GCReW Symposium Poster Ideas

- Take a look at synoptic site porewater data and look through the years to see if we are observing increases in specific analytes through time in the transition zones compared to uplands/wetlands.
- Specifically looking at SO4, Cl, H2S, and DOC to see if we are seeing salinization and subsequent DOC release
- Analyses to look at variation through space and time. This would be comparing depths to see if there are significant differences across 10, 20, and 45cm. Also may look at interannual variation - do we see significant differences across years? what about zones?

Analytes by Depth:

Samples: SO4

Samples: Chloride

Samples: Sulfide

Samples: NPOC

Samples: TDN

Sulfate at the various zones:

Plotted SO4/Cl through time as scatterplots/boxplots: There seems to be a seasonal trend but not so much a trend across years.

DOC vs SO4/Cl for only Transition Zones: Looks like a generally inverse relationship.

Plot of NPOC vs Cl for TR Zone
GCW
GWI
MSM
SWH
R^2 = 0.10, P = 0.033
R^2 = 0.08, P = 0.029
R^2 < 0.01, P = 0.690
R^2 = 0.07, P = 0.007

Graphed SO4 vs H2S in Transition Zones: It seems to be a generally inverse relationship, as expected.

H2S and SO4 vs Depth: Looks like SO4 decreases and H2S increases with depth.

It looks like maybe SO4/Cl is increasing in the TR at GCW? Missing SWH UP 2025 SO4/Cl data?

No pattern in H2S data?

No pattern in DOC data?

DOC decreases as SO4 increases across Zones?

No clear pattern in NPOC vs Cl?

Sulfide, Sulfate, and TDN seem to have the largest differences by depth
